A graduate of the Royal College of Art, my practice sits at the intersection of art, science, and marine ecology. With a professional background in science and technology, I translate complex fluid dynamics and biological forms into vibrant, sustainable glass sculpture. My work is exhibited and collected globally, with a recent landmark acquisition by The John & Mable Ringling Museum of Art for their permanent glass collection in the United States.

Deeply committed to a circular practice, I utilise repurposed and re-melted waste glass to bridge the gap between high-level artistic expression and environmental responsibility. From my studio in Wales, I continue to explore how the 'alien beauty' of the ocean can foster a deeper human connection to our natural world.
